MAN-C

- Housing Ø100 + 160 mm
- Connection DIN or ANSI flange
- Basic material: stainless steel
- Wetted parts: ECTFE and PTFE
- Measuring ranges: 25 mbar ... 25 bar
- Medium temperature up to 200 °C
- Option: filling liquid, contacts, transmitter, overpressure resistant

P1

Application

KOBOLD all stainless steel diaphragm pressure gauges are preferably used for aggressive media where standard diaphragm pressure gauges are challenged. Diaphragm pressure gauges have a relatively high actuating force. The circular diaphragm is insensitive to jarring or vibration. An extremely high resistance to overpressure is achieved by underpropping the diaphragm.

For highly viscous, crystallising or strongly heterogeneous media, open flange connections are used. The wetted parts are coated by high quality polymers (PTFE/ECTFE) for specific use with aggressive media. Also the used seals are made of PTFE or covered by it.

In contrast to pressure gauges assembled with membrane chemical seals, the accuracy and zero point stability is ensured over a bigger temperature range. Even the mechanical stability and robustness is multifold in comparison to sensitive membrane chemical seals.

Measuring Principle

The weld-in or clamped diaphragm is subjected to pressure from one side. The pressure bends the diaphragm and an indicator mechanism converts the amount it is bent into a corresponding movement of the pointer. The scale on the dial then shows the actual pressure. Because of the diaphragm's shape and the fact that it is mounted on the side means it is mechanically very stable, and consequently less susceptible to vibration than Bourdon gauges.

Housing

The following housing diameters are available: 100 mm and 160 mm. The housing material is stainless steel.

Installation

The gauges are most often installed straight into the customer's screw necks. Open measuring flanges for special operational conditions are available either as Norm or customer specifications.

Connection

The gauges are supplied with DIN or ANSI flanges. Other flanges are available as per Norm or customer specifications.

Measuring Ranges

The measuring ranges are graduated according to DIN recommendations and lie between 25 mbar and 25 bar. Other scales with measuring ranges in PSI, Pa or as OEM version are available on request.

Damping Liquid

Pressure gauges with liquid filling are used in locations with high alternating dynamic loads, strong vibrations and pulses. The filling ensures easy readability through steady pointer movement even when subjected to extreme loading and heavy vibration. The lubricating effect of the glycerine also keeps wear to a minimum. Glycerine is always used as a matter of principle.

In gauges with a contact or an electrical measuring transducer, liquid paraffin is used as a non-conductive alternative. Silicon fillings of various viscosities are also optionally available.

Contacts

For monitoring the system pressure, gauges with 100 mm or 160 mm diameter can be fitted with up to four limit contacts. Slow action, magnetic spring, inductive and pneumatic contacts are also available. (see website »Contact Fittings for Pressure Gauges«).

Fields of Application

- Chemical and petrochemical industries
- Plastics and paper-manufacturing industries
- Food and beverage industries
- Machine and plant construction
- Process technology
